

### **Marijuana (Grass, Pot, Hash, etc.) Use:**

Close to one-third (30.2%) of adults in Tennessee had used marijuana at least once in their lifetimes. In the 12 months before the interview, 5.7% of adults had used marijuana, while 30-day users comprised 3.7% of adults in Tennessee. While 18.8% of lifetime marijuana users had used marijuana in the past 12 months, 12.3% of lifetime users had used marijuana in the past 30 days.

The age at first use for marijuana was, on average, 18.1 years.

### **Cocaine or Crack Use:**

Fewer than 1 in 10 (7.7%) adults in Tennessee had ever used cocaine or crack, while the percentages of 12-month and 30-day users were less than 1% (0.7% and 0.2%, respectively). Over 9% (9.1%) of lifetime cocaine or crack users had used cocaine in the past 12 months, while 2.4% of lifetime users had used cocaine or crack in the past 30 days.

The age at first use of cocaine or crack, on average, was over 21 (22.5 years).

### **Heroin (Smack, Horse, Skag, etc.) Use:**

Very low percentages of heroin users were observed through the survey. The lifetime users represented 0.6% of adults in Tennessee, while 12-month users comprised 0.1% of adults. Only one individual reported being a current (30-day) heroin user. Nearly 20% (18.8%) of lifetime heroin users used heroin in the past 12 months, while 6.3% of lifetime users had used heroin within the past 30 days.

The average age of onset for heroin use was 20.8 years.

### **LSD (Acid) or other Hallucinogens Use:**

Less than 10% (7.6%) of adults in Tennessee reported having ever used LSD or other hallucinogens. Twelve-month users comprised 0.4% of adults, and 30-day users represented 0.1% of Tennessee adults. Twelve-month LSD or other hallucinogen users comprised 5.3% of lifetime users, while 30-day users represented 1.0% of lifetime LSD or other hallucinogen users.

The age at first use for LSD or other hallucinogens was, on average, 18.8 years.
